

RT-PCR analysis: Expression of retrovirally encoded reprogramming factors in human iPSC lines NP0014-5 and NP0014-6 (date of analysis: 17-12-2014)

M – DNA marker, * positive control; **negative control
 Note: cDNA was made from 500 ng RNA, from the control plasmid in lane 1 we took 50 ng DNA. PCR was done with 60°C annealing temperature and 32 cycles. The gel run: 1 hour at 150V.
